Make a Medicine Dropper

YOU NEED

- drinking straw
- glass of water
- empty glass

You can make a regular drinking straw into a medicine dropper. Suck up some liquid into the straw. Hold it in the straw by covering the top of the straw with your finger. Then bend your finger slightly and raise and lower your fingertip so that the liquid flows out one drop at a time.

Experiment with the straw until you get the knack of it. It's easy to do.
