Let's Look at Water & the Scientific Method

Learning Objectives
Students will:
1. Identify the physical and chemical properties of water.
2. Compare and contrast water to other liquids.
3. Use and demonstrate the scientific method.

Background
Water is all around us. It is the most common substance on the Earth's surface, covering nearly three-quarters of the planet. Water comes in many different forms such as rain, snow, and water vapor. It can be found in many different places such as the air, glaciers, and the human body.

All living things need water to survive. Humans need 2.5 quarts of water every day, which we get from drinking water, eating food, and breathing and absorbing moisture in the air. Did you know that up to 75% of the human body is water? Every day, the average American uses 100 gallons of water for cooking, drinking, bathing, and washing clothes, dishes and cars.
But what is water? Water is a colorless, odorless, tasteless liquid made of two elements called hydrogen and oxygen.

What is a liquid? A liquid is one of the three states or forms of matter. Any object that takes up space and has mass is called matter. Everything around you is made of matter, including the air you breathe, the water you drink and the chair you are sitting in. Liquids are fluids that typically take the shape of the container they fill. Water is different from other liquids. It is unlike any other substance on Earth, and we know this because of its unique properties or characteristics.

All matter has properties. Water has two basic types of properties: physical properties and chemical properties. A physical property is a characteristic that can be identified through one of our five senses (sight, touch, taste, smell, and hearing). A chemical property describes the way a substance will change or react to form another substance.

A scientist is a person who explores the natural world in order to better understand it. Scientists investigate different areas of science such as biology, physics or the environment. There are many different types of scientists who study the different properties of water. Some examples of scientists who study water include chemists who examine how water interacts with other elements; meteorologists who study how water interacts with the atmosphere to create weather conditions; and ecologists who study how water is connected to the environment.
The scientific method is a set of techniques that scientists use to investigate something interesting or puzzling. You can follow these steps to research almost anything:
1. Develop a question about something interesting, puzzling or problematic.
2. Gather information about your questions.
3. Form a hypothesis (a proposed explanation or an educated guess) and make predictions based on the information gathered.
4. Perform experiments and make observations to test the hypothesis and predictions.
5. Analyze your findings or results of the experiments.
6. Make conclusions based on the findings.
7. Share the results of your investigation.

Good scientists use their senses to investigate the topics they are studying; however, because some substances are harmful, we will not be using our sense of taste during these experiments. Scientists also record their observations, questions, predictions, results and diagrams in a field journal so they may refer back to them at a later time.

Investigation: Getting Our Feet Wet

ON TO Part 1: Making Senses of Water

Time Needed to Conduct, Investigation
This investigation has 4 parts.
1. Organize and set up materials: 10 minutes
2. Introduce the lesson: 5 minutes
3. Conduct the investigation: 45 minutes
4. Discussion: 10 - 15 minutes
Total estimated time: 70 - 85 minutes
PART 1: Making Sense of Water
GET READY!

Brainstorm

Ask students what they think of when they hear the word "water". Record your students' answers on a flipchart or blackboard. Your students will record ideas in their student journals.

Ask students to share what they know about water:
1. What is water?
2. Where does water come from?
3. Why is it important?
4. What makes water different from other types of liquids?
5. Who studies water, and how?

PROCEDURE

Inform your students that they will be conducting several experiments using parts of the scientific method to learn about some of water's unique physical properties. Ask students to identify the steps to the scientific method as they conduct the investigation.

After your students complete this investigation, bring them together for a group discussion to reflect upon their results before moving on to the next part. Remind students that, as a good scientist would do, they should share their findings for each activity, and record the results in their journals.

1. Before you begin the investigation, ask students to choose two liquids from the materials list to compare with water.
2. Fill each of the cups with 100 mL of the three liquids (two choices plus plain water).
3. Label each cup of liquid with masking tape.

Materials

For groups of four:

- Ten 9 oz. clear plastic tumblers
- 200 mL measuring cup or beaker
- Masking tape
- Pen
- 1/2 liter bottle with tap water
- Paper towels
- Sponges for cleanup
- Karo syrup
- Writing pads

Choose two of the following liquids:

- 1/2 liter white vinegar
- 1/2 liter baby oil
- 1/2 liter seltzer
- 1/2 liter salt water (3/4 cup of salt mixed with 1/2 liter of water)
- 1/2 liter soapy water (1/2 liter of water mixed with liquid soap)
PREDICT
Much in the same way that scientists use the scientific method to investigate something interesting, students will make predictions in this experiment based on what they already know about water. Have your students predict what differences and similarities they expect to find between water and the other liquids in this experiment.

OBSERVE
Ask students to make some simple observations and record them in their student journals in the chart format provided:
• How does each liquid look?
• What is the color?
• Is it runny or thick?
• Do any of the liquids have an odor?
• What is the texture? How does each liquid feel when you rub the liquid between your fingers?

SAFETY TIP
Instruct students NOT to stick their noses directly into the cups because some materials are hazardous to inhale directly. Use the wafting technique by holding the cup with one hand and waving the other hand over the opening of the cup to draw the odors towards the nose.
PART 2: This Way and That Way
Distribute additional materials and ask students to use the popsicle sticks and plastic spoons to make various observations.
• How does each liquid look when you stir it with a popsicle stick?
• What does each liquid do when you swirl it around in the cup using a circular motion?
• How does each liquid behave when you scoop it up with a spoon?
• What happens when you drop each liquid back into the cup from the spoon?
• Do the liquids make a sound?

Part 3: A Little at a Time
Have students use eyedroppers or straws to pick up the liquids and drop, a little at a time, onto the various materials provided.

TIP
To pick up liquid using the straw, have students dip one end of the straw into the liquid and place a fingertip over the other open end of the straw, then lift the straw out of the cup.

Part 2: Materials
• All materials from Part 1
• Popsicle sticks
• Plastic spoons

Part 3 Materials
• All materials from Parts 1 and 2
• Straws or eyedroppers
• Waxed paper
• Aluminum foil
• Brown coffee filters
• Dry sponges (no scrubber side)
• Toothpicks
• Rulers
PART 4: Drop, Plop
Distribute additional materials and ask students to discuss their observations with their partner or group.
• How do the liquids look when dropped onto each material?
• How does each liquid react when you move it around with a toothpick on the material?
• What happens to each liquid when you tilt the material to one side?

Have students use rulers to measure how far each liquid spreads out on the coffee filter.
• If you quickly wave the coffee filter back and forth, do any of the liquids begin to disappear?
• Why do you think this is occurring?
• If the liquids do disappear, try adding additional drops and time how long they take to disappear completely.

Distribute additional materials and ask students to select three objects for this experiment. Use additional cups and liquid, if necessary.
Have students drop their three selected objects into each of the liquids, making observations as they go. Students can discuss their results with their partner or group.
• What happens when each material is dropped into the various liquids?
• Which material floated? Which sank?
• Which disappeared?
• Which caused a reaction?

Part 4: Materials
• All materials from Parts 1, 2, and 3
• Additional 9 oz. cups

Students will choose three of the following objects:
• Raisins
• Biodegradable starch packing peanuts
• Styrofoam packing peanuts
• Beads
• Corks
• Sugar
• Salt
• Baking soda

---

experimental cup set-up
To wrap-up the investigation, bring your students together for a group discussion to help them understand why and how they achieved their results. It is important to share results so that everyone has a clear picture of what happened. To help you facilitate the discussion, review the explanation in "The Why and The How" using the Group Discussion questions as a guide.

Group Discussion
Explain to students that scientists learn from each other through discussion, and they build upon the work of others to make new discoveries. Just as scientists come to conclusions based on the findings of their experiments, they will now come together as a group to share their results and make conclusions about the investigations they've conducted. Have students record their final results and the explanation in their journals.

• What did you learn about water in comparison to other liquids?
• Which liquids behaved similarly/differently?
• What surprised you?
• What other liquids would you like to test?
• What new questions do you have?

The "Why" and The "How"
At first glance, the various liquids tested in this lesson look quite similar, but each has different characteristics, or properties, that make them unique. Each liquid reacts differently during a particular test. Just as each liquid has different properties, so do the other materials used in each part of the investigation. This is why the same liquid may have reacted differently on waxed paper as opposed to on a coffee filter. For example, some liquids are thin and flow or pour easily. Other liquids are thick and gooey. Honey, shampoo or corn syrup flow or move more slowly than water because of a unique property called viscosity. Viscosity is a liquid's resistance to flowing.
