Observing pollen grains from different flowers
You need to get several flowers in which the pollen has formed on the stamens. Shake pollen from each flower on different pieces of black or dark paper. Observe each type of pollen with a magnifying glass and note any differences.

Germinating pollen grains
Make a strong sugar solution and place it in a shallow dish like a saucer. Shake pollen from several kinds of flowers onto the surface of the sugar solution. Cover with a sheet of glass and let it stand in a warm place for several hours. If the experiment is successful you will be able to see little tubes growing from the pollen grains. Use a hand lens.
